Running title : Minority stress and depression in Thai LGBT

Synopsis : Forty percent of Thai LGBTs surveyed met criteria for depression. Consistent with study hypotheses, minority stressors including discrimination, victimization, and identity concealment predicted depression scores.

Informed consent of patient :  Yes  None

Conflicts of Interest : The authors have no conflicts of interest to declare.

Acknowledgment : The authors would like to acknowledge the Rainbow Sky Association of Thailand for their support in the data collection and to thank study participants. Dr. Matthews' efforts in the development of this manuscript were support by funds from the University of Illinois Cancer Center. Efforts on this publication were also supported by the National Institute on Minority Health and Health Disparities of the National Institutes of Health under Award Number U54MD012523.
